

Best Practice Procedures for Fitting Amplification in Infants

Seewald, R. C.

Increasingly, hearing health care professionals are required to follow preferred practice guidelines and submit scientific evidence in support of the clinical procedures they apply. This presentation will describe the growing consensus seen in recently published preferred practice guidelines on best practice in pediatric amplification and in generic hearing instrument prescription and fitting procedures developed for application with infants. Particular attention will be given to special considerations in the audiometric assessment, electroacoustic selection and verification stages of the pediatric amplification fitting process.
